

Laser Marking System Laser Marking Rotary System

This machine marks parts with anything from part numbers to barcodes to directions for customer with a laser. When operating this machine the operator loads a part onto the fixture and after a few seconds the table will index it into the machine. While in the machine, two lasers on two stations mark product information on the part. It is able to do this very fast and accurately.

This machine has a touch screen to select different parts to run so multiple products can go through one machine. It also has light curtains on both open stations for two operators for faster production. The machine is made to be light-tight so none of the reflected laser light gets out and harms the operator. It also has sight glass designed to absorb the laser but allow for inspection of inside of the machine.
