

## Automated Milling

### Automated Milling Machine

This system was developed for a customer that needed to de-gate a part but did not have the ability to use cutters or automated removal. The operator loads the part and presses the start button. The machine then clamps the part and starts a CNC milling cycle.

This machine also has a light curtain for added protection and complete control of the CNC program to ensure the cut is accurate for hot or cold parts. There is also a vacuum system to remove the chips as the milling is taking place.
