

Eight-Head Shelf Welder

UW-7

General Description

This machine utilizes eight welders to weld a screen into position in a single weld position. In this application, the welders must weld at the same time to ensure the screen would be pulled taught. The fixture is on a slide for easy operator loading. Six welders are hub mounted but two of the welders are mounted on a bridge so the fixture and parts can be moved to the weld position. The customer tried heat staking to save money, but the screen would not stay taught.
